PROJECTS

Psychological Screening System

Live Link | **GitHub Link**

Tech stack: Django • PostgreSQL • React

Online psychological screening system for universities designed to assess students' psychological state through structured tests. Administrators can create and manage screening tests, while students complete assigned questionnaires online and receive automatically processed outcomes for review.

Key features of the project include:

- Administrative workflow: Provides a dedicated admin interface for creating, editing, publishing, and monitoring screening tests and student submissions.
- Student testing: Gives students a clear online flow for opening assigned questionnaires, answering questions, and submitting completed assessments.
- Automatic analysis: Processes submitted answers and prepares results so administrators can review outcomes without manual calculation.
- Results tracking: Keeps test attempts and completion information available for follow-up and evaluation.
- Structured data layer: Uses PostgreSQL to store tests, questions, students, responses, and result data in a reliable relational model.
- Role-based operation: Separates administrator actions from student-facing testing to keep the workflow organized.

Built as a practical full-stack system combining a React interface with a Django backend and PostgreSQL database for an end-to-end screening workflow.

Online Olympiad Telegram Bot

Live Link | **GitHub Link**

Tech stack: Python • Telegram Bot API

Telegram bot for running online olympiads for students directly inside Telegram. The system supports test creation, question management, scheduled or time-limited sessions, and participant result tracking, keeping the complete competition workflow in one familiar interface.

Key features of the project include:

- Test creation: Lets organizers create olympiad tests and prepare complete question sets directly through Telegram interactions.
- Question management: Supports adding, reviewing, and organizing questions before a test is published to participants.
- Time limits: Provides configurable start times and time-bounded sessions so tests can be run as scheduled competitions.
- Participant flow: Guides students through the active test, collects answers, and handles the submission process inside Telegram.
- Result tracking: Records participant submissions and makes results available for review after completion.
- Telegram-first UX: Uses inline buttons and conversational steps to reduce friction for both organizers and students.

Combines Python automation with the Telegram Bot API to deliver a practical competition and assessment workflow without requiring a separate web application.

PROJECTS

TheHotelSaaS

Live Link | **GitHub Link**

Tech stack: Next.js • Node.js • MongoDB • SerpAPI • Tailwind CSS

A hotel management SaaS platform that evolved from the RateRadar rate-monitoring concept into a broader hotel operations product. It brings hotel workflows, rate intelligence, and market information into a single web-based platform for day-to-day management.

Key features of the project include:

- Hotel operations: Centralizes day-to-day hotel management workflows and monitoring in a single dashboard-oriented product.
- Rate monitoring: Extends the original RateRadar concept with hotel-focused pricing and rate-monitoring capabilities.
- Market intelligence: Integrates market data through SerpAPI to support rate comparison and informed pricing decisions.
- Scalable web stack: Uses Next.js and Node.js to structure the application across modern front-end and server-side workflows.
- Data persistence: Uses MongoDB for application data and operational records.
- Modern interface: Tailwind CSS supports a responsive, dashboard-oriented experience suitable for daily hotel operations.

The project demonstrates full-stack SaaS development across product design, server-side workflows, database integration, and external data services.

ArtSuzani

Live Link | **GitHub Link**

Tech stack: Next.js 14 • TypeScript • Stripe

Premium e-commerce platform for Uzbek handicrafts, built around a CMS-driven catalogue and a modern purchasing experience. The storefront combines product discovery with cart and wishlist functionality and secure Stripe checkout for online payments.

Key features of the project include:

- CMS-driven catalogue: Organizes Uzbek handicraft products into a maintainable catalogue and collection structure.
- Product discovery: Presents product information and collections through a polished storefront designed for browsing and comparison.
- Cart and wishlist: Supports saving products for later and managing selected items before checkout.
- Stripe checkout: Integrates Stripe for a secure, production-oriented online payment flow.
- Modern storefront: Uses Next.js 14 and TypeScript to deliver a fast, responsive e-commerce interface.
- Brand-focused presentation: Combines commerce functionality with a visual style tailored to traditional Uzbek handicrafts.

The project combines modern commerce architecture with a culturally focused storefront, covering catalog management, shopping workflows, and payment integration.

PROJECTS

Diyorbek Portfolio

Live Link | **GitHub Link**

Tech stack: Next.js • React • TypeScript • Node.js

Personal portfolio website presenting Diyorbek's development profile, technical skills, and completed work. The site acts as an online professional presence with dedicated project showcases, technology information, contact access, and a clear presentation of full-stack capabilities.

Key features of the project include:

- Professional portfolio: Presents completed software projects and demonstrates practical front-end and back-end development skills.
- Project showcase: Gives each project a dedicated presentation area so visitors can quickly understand the purpose and technical stack.
- Technology overview: Communicates the main tools and frameworks used across web applications, back-end systems, and Telegram bots.
- Professional profile: Clearly communicates the Full Stack Web Developer role, location, availability, and technical focus.
- Contact access: Provides a direct path for potential clients or employers to start a conversation about projects and opportunities.
- Responsive presentation: Uses a modern portfolio layout intended to stay readable and usable across different screen sizes.

Serves both as a professional portfolio and as a working demonstration of Diyorbek's approach to modern web development.
